

innovative displays,
endless possibilities

flexyPage displays are innovative displays that offer the user almost unlimited scope for use and design, thanks to their modern software. The displays can also be used outside the lift and can be individually adapted to the wishes and needs of the user through their numerous functions.

New Functions

Destination input function via the touch displays of the DM line.

Chat function for the support of hearing-impaired users in an emergency, with which an emergency call center can chat with the user via the touch displays.

Video streaming from network cameras, a video server or from Youtube videos as well as from TV channels.

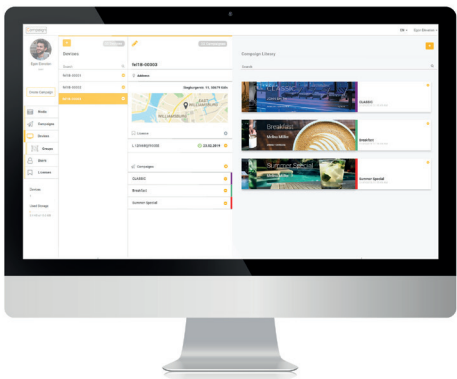

The game Tic Tac Toe, which can be used for entertainment on the touch displays while riding in the lift or waiting before hand.

flexyPage Manager

The flexyPage Manager allows the management and remote configuration of your displays over the Internet. Again, there are many new features, e.g. a corporate account with integrated user management and the automatic backup of snapshots of the display configuration every time you change the cloud.

flexyPage Campaign

The web application flexyPage Campaign is used for centralizing and distributing information and advertising in elevators. In flexyPage Campaign, campaigns can be created and displayed on groups of displays in a timely and event-driven manner.
